

Great Landclearing Tools for Excavators

The Right Equipment for Maximum Productivity

BT-H Hydraulic Thumb

Get maximum productivity with a hydraulic strut. The thumb is always ready for instant use and will quickly swing out of the way when not needed. The clamping ability of a hydraulic strut can position material as well as clamp loads. Rockland hydraulic struts provide over 135 degrees of operating range for maximum material handling capability. The heavy-duty cylinder rods are chrome plated and induction hardened for years of dependable service.

BT-S Solid Strut Thumb

These are ideal for contractors that either need to use thumbs occasionally or have an application that will use the thumb in one position for a long period of time. A unique advantage of Rockland solid strut thumbs is that the strut does not have to be removed to store the thumb against the stick. Heavy lifting and strut hunting is eliminated. Solid strut thumbs are the low-cost way to turn your excavator into a land clearing machine.

Rockland Rhino

The Rockland Rhino is the best way to clear land with an excavator. It is designed to slice lateral roots with minimum soil disturbance. The Rhino's twin rippers deliver slice and move capability. Its sharp front hooks split and lift. The Rhino's strong teeth are guaranteed for life against bending and breaking. Made from high-strength alloy steel plate, the Rockland Rhino is designed for years of dependable service.

Rhino and BT-H Thumb

Double the benefits of these great landclearing tools by putting them both to work on the same excavator! The Rhino slices through the root systems and pulls stumps from the ground. The thumb makes stump handling easy and guarantees large capacity payloads. Landclearing contractors profit from huge productivity gains when their excavators are equipped with Rockland Rhinos and bucket thumbs!

EX Excavator Rake

Turn your excavator into an efficient landclearing machine with a Rockland Clearing Rake. The clearing rake's long tough teeth are built of high-strength heat-treated alloy steel for years of heavy-duty land clearing service. They are curved for maximum rolling and sifting action. They project forward far enough so that loading land clearing debris is fast and efficient. If the job requires handling large capacity loads, use the clearing rake with a Rockland thumb to obtain maximum material handling capability.

ST Stump Splitter

Rockland Stump Splitters quickly reduce stumps and other wood debris to proper size for tub grinding or burning. The ST crushes and splits by using the full power of your excavator's curl cylinder. The STH delivers extra splitting power with a heavy-duty hydraulic cylinder that provides additional power to the back half of the stump splitter. Both models are made entirely from heat-treated, quenched and tempered, high-strength alloy steel. The ST and STH both feature weld-in, 500 Brinell replaceable cutting edges, oversize seal bushings and bearings for years of dependable service.
